EXPERIENCE

Software Development Engineer - Amazon Luna

Mar 2024 - Sep 2024

Amazon.com

Irvine, CA

- Refactored the controller metrics pipeline to surface data on previously untracked controllers, raising labeled coverage by 30% and producing the dataset that drove the decision to expand official controller support.
- Investigated Sentry issues across browser and native clients, separating TypeScript regressions from external platform failures to scope fixes and vendor escalations.
- Designed a client version-monitoring system that polls a build infrastructure endpoint as the source of truth for current and supported versions, detecting client staleness within a configurable window.

Software Development Engineer Intern - Amazon Luna

Jun 2022 - Sep 2022

Amazon.com

Irvine, CA

- Shipped a cross-platform volume control feature in TypeScript and Swift to browser and macOS, filling a gap that previously required users to rely on OS-level controls.
- Instrumented the volume adjustment feature with OpenSearch telemetry to track per-game audio adjustment patterns and inform decisions on default configurations and feature retention.
- Wrote a requirements document that resolved competing proposals from PM and UX and locked scope before development started.

PROJECTS

HSREndgameDB | *Next.js, React, PostgreSQL, Node.js* | hsrendgamedb.info

2024 - Present

- Built and maintained a full-stack web app for community-submitted game walkthroughs, where players browse strategies filtered to the characters they own.
- Diagnosed accumulated technical debt and UX gaps across the site, then rebuilt search discoverability, the feed interface, and page performance to grow monthly traffic 671% to over 700 visitors.
- Held monthly Neon compute flat as traffic grew by adding server-side caching and optimizing the schema and queries to fetch only the data each view needs.

SteamLens | *TypeScript, React, Express.js, Python* | [Chrome Web Store](#)

2024 - Present

- Built a Chrome extension and Express.js API that pulls Steam, IGDB, and ProtonDB data for a game into one popup in a single parallel fetch.
- Designed an adapter registry that detects the game on the current page to pre-fill search, so new sites plug in without changes to core detection.
- Wrote a Python ETL that normalizes and caches 100k+ Steam library entries, with roman-numeral and alternate-name matching that cut search latency up to 25%.

EDUCATION

University of California, Irvine

Sep 2019 - Jun 2023

Bachelor of Science, Computer Science - GPA: 3.5

Irvine, CA

- Specialization in Information: coursework in information retrieval and database management.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, HTML/CSS, Java, Swift

Frameworks: React.js, Next.js, Express.js, Angular, Tailwind

Tools: Git, Jira, Postman, Vercel, Sentry, OpenSearch

Testing: Jest, Pytest

Databases: PostgreSQL, MySQL, NoSQL
