Experience

Software Development Engineer, Amazon Luna

Mar 2024 – Aug 2024

Amazon.com

Irvine, CA

- Refactored the controller metrics pipeline to classify unidentified devices, raising labeled coverage 30% and shipping a dashboard non-technical stakeholders used for support decisions.
- Traced defects through Sentry monitoring across browser and macOS clients, separating TypeScript regressions from external platform failures to scope fixes and vendor escalations.
- Reviewed intern pull requests across multiple cycles, holding them to the TypeScript client's null-safety and typing conventions before merge.

Software Development Engineer Intern, Amazon Luna

Jun 2022 – Sep 2022

Amazon.com

Irvine, CA

- Built and shipped an in-app volume control in TypeScript and Swift for browser and macOS, filling a gap that forced users onto OS-level audio settings.
- Created automated Jest suites for the volume feature's UI components, running on every merge to cover control behavior and cross-platform rendering without manual regression passes.
- Defined the acceptance criteria the volume control was built and tested against, reconciling competing PM and UX proposals into a spec two teams peer-reviewed.

Projects

HSREndgameDB | *Next.js, React, PostgreSQL, TypeScript* | hsrendgamedb.info

2024 – Present

Searchable, filterable video index of community-submitted gameplay walkthroughs

- Grew monthly traffic past 1,000 visitors by pairing an SEO overhaul with automated content submission that widened the site's indexable surface.
- Reduced load on PostgreSQL with server-side caching and queries scoped to only what each view needs, keeping monthly compute flat as traffic grew.
- Automated metadata extraction with a Python OCR pipeline that reads designated regions of gameplay footage, cutting manual entry per post 60%.

SteamLens | *TypeScript, React, Express.js, Python* | [Chrome Web Store](https://chrome.google.com/webstore/detail/steam-lens)

2024 – Present

Chrome extension aggregating pricing, ratings, and compatibility data into a single popup

- Developed four async Express.js endpoints over the Steam, IGDB, and ProtonDB APIs, so one extension search resolves through parallel calls.
- Built a Python ETL that fetches, normalizes, and stores 100k+ Steam library entries, preprocessing alternate names and roman numeral forms at ingest to cut search latency by up to 25%.
- Built an adapter-based system that automatically detects the game on the current page to pre-fill search, and extends to new websites without rewriting core logic.

Education

University of California, Irvine

Sep 2019 – Jun 2023

Bachelor of Science, Computer Science, GPA: 3.5

Irvine, CA

- Specialization in Information: coursework in information retrieval and database management.

Technical Skills

Languages: TypeScript, JavaScript, Python, HTML/CSS, Java, Swift

Frameworks: React.js, Next.js, Express.js, Angular, Tailwind

Tools: Git, Jira, Postman, Vercel, Sentry, OpenSearch

Testing: Jest, Pytest

Databases: PostgreSQL, MySQL, NoSQL

Practices: Agile, Scrum, sprint planning, code review, regression testing
